

KME Italy S.p.a. and EGM Group launch a study for a strategic project

***Development of the business of rolled products in copper and copper alloys
for energy transformation and sustainable development***

KME Italy S.p.A. and EGM Group, primary Italian companies operating nationally and internationally in the field of non-ferrous metals, have launched a study for a project aimed at achieving a synergic development of the rolled products business in copper and copper alloys (which is currently operated by KME Italy S.p.A. in its plant located in Fornaci di Barga), with the aim of strengthening the service in the industrial supply chains mainly affected by future development processes.

It is foreseen that, if the project is finalized, the activities of EGM rolled products division (located within the Brescia plant) will be able to be developed in synergy by the two companies on the basis of their respective technical, production and distribution resources, to offer international supply chains industrial solutions capable of satisfying an increasingly competitive landscape.

This project derives from the awareness that the market of products in copper and copper alloys is increasingly characterized by a high technical and technological complexity, driven above all by the acceleration that the energy transformation and sustainability of renewable sources has undergone in recent times, and therefore, the project pursues the objective of adequately responding to these new and challenging needs.
